

## Abstract

A system for integration of actual product costs (1) can calculate a product's actual costs by adding the product's value-added costs and the product's material costs. The system for integration of actual product costs is connected to a number of client terminals (3), a general ledger management system (4), a manufacturing process management system (5), a work order management system (6), a purchase management system (7), an inventory management system (8), and a production management system (9). The system for integration of actual product costs includes a web server (12), a database server (14), and a database (16). The web server includes a value-added costs integration module (121), a material costs integration module (122), an actual costs integration module (123), and an actual costs enquiry module (124). A related method is also provided.
